Task 1

1.1)

Line 16:

```
app.patch("/milestones1:id", function (req, res) {
```

Lines 17-23:

```
const milestoneId = req.params.id
```

```
const data = req.body
```

```
const milestoneIdx = milestones.findIndex(milestone =>  
milestone.id === milestoneId)
```

```
if (data.name) {
```

```
  milestones[milestoneIdx].name = data.name
```

```
}
```

```
if (data.deadline) {
```

```
  milestones[milestoneIdx].deadline = data.deadline
```

```
}
```

```
if (data.tasks) {
```

```
  milestones[milestoneIdx].tasks = data.tasks
```

```
}
```

```
return res1.json(milestones[milestoneIdx])
```

|  |   |   |  |

## Task 2

2.1)

POST /milestones

I would expect to use this API method to create a new milestone. I expect to be able to pass new milestone data in the request body.

On success I would expect to get a 201 status code with just created resource. On failure I would expect 400 when an incorrect data was passed in the request body. (4)

POST /milestones/:milestone/tasks

I would expect to use this API method to create a new task resource that will be associated/related to an already existing milestone.

I would expect 201 status code and just created resource in the response on success. On failure I would expect either 400 (incorrect data) or 404 when milestone with the specified Id could not be found.

|          |                               |   |  |
|----------|-------------------------------|---|--|
| CHALMERS | Anonymous code                | Points for question<br>(to be filled in by teacher) | Consecutive page no.<br>Löpande sid nr 4 |
|          | Anonym kod<br>DIT342-0008-UXU | Poäng på uppgiften<br>(fylls av lärare) 11,5        | Question no.<br>Uppgift nr 2             |

2.2)

GET /milestones/67f60a2/tasks/001

A 404 response from this endpoint could mean that either a task with id „001“ does not exist or that a milestone with id „67f60a2“ does not exist.

GET /milestones/67f60a2/tasks

A 404 response in this case means that a milestone with id „67f60a2“ does not exist. (3)

In this scenario I would expect the endpoint to return an empty array when there are no tasks associated with an existing milestone. Rather than returning a 404 (since we are not trying to access a specific task resource)

2.3)

GET /milestones/d828fcd8/tasks?status=completed (3)

2.4)

2xx - success response - returned when everything went as expected

3xx - redirect - returned when for example a resource was moved (3)

4xx - client error - returned when a client made an error by either providing wrong data, not being authorized, authenticated, etc.

5xx - server error - returned when a problem occurred on the server side. Client cannot do much about it.

2.5)

The „main“ ones are: GET, PUT, DELETE (1,5)

## Task 6

An IP stands for an Internet protocol and is the most important protocol on the 3 layer of the OSI model (the network layer)

In general, IP is responsible for routing and addressing of data packets between nodes/clients over networks. It is a connectionless protocol (one payload is sent at a time) and an unreliable protocol (data may or may not get to the other client)

TCP stands for Transmission Control Protocol and is a protocol mainly working on a 4 layer of the OSI model (the transportation layer).

The main job of TCP is to deliver packets between two nodes (it is a unicast protocol). TCP is reliable (makes sure that packets are delivered to the receiver, lost packets are re-sent) and ordered (packets reach their destination in the same order they were sent)

## Task 7

Cookies are key-value pairs set by the server and then included in each client's response. 7

## First page request ①

GET / HTTP/1.1

← Client calls an endpoint

Host: localhost:3000 2

~~Accept: application/json~~

## Response with a cookie ②

HTTP/1.1 200 OK

← Server responds with 200 OK and sets a cookie that is included in the response header 7

Set-Cookie: foo=bar

## Request to the server after a cookie was set ③

GET /users HTTP/1.1

Client stored/saved the

Host: localhost:3000

← received cookie from the 7

Cookie: foo=bar 7

server in the cookie storage and will include it with in the header with the next request

valid domain, expiry

## Task 8

On-premise hosting means that, for example a company buys required hardware and setup their own servers and infrastructure that they could use for their own needs.

- ( Cloud hosting on the other hand allows the company to "buy" those servers, tools, and initially setup infrastructure from one of the cloud providers.

Key differences between those approaches

On-premise hosting:

- > big (or bigger) up-front costs related to buying required hardware and setting up an infrastructure
- ( -> on-premise hosting <sup>servers</sup> needs to be maintained and updated
- ( -> a company has to have an actual space for servers in their office
- > high flexibility and independence about how those hosting resources can be utilized
- > potentially smaller costs in the long run in comparison to cloud hosting

|          |                               |   |   |
|----------|-------------------------------|---|---|
| CHALMERS | Anonymous code                | Points for question<br>(to be filled in by teacher) | Consecutive page no.<br>Löpande sid nr 12 |
|          | Anonym kod<br>DIT342-0008-UXU | Poäng på uppgiften<br>(fylls av lärare) 10          | Question no.<br>Uppgift nr 8              |

## Cloud hosting

- small up-front costs (pay only for what you use)
- no need to update and maintain the servers and the core infrastructure
- no need to have space for actual servers
- less flexible
- prone to vendor-locking and being dependent on the cloud provider's environment
- potential sky-high costs in a long run related to computations, capacity, and load.
- faster and easier to start working with especially when a cloud providers provides IAC which can be used to setup an infrastructure and control it using code, rather than doing it manually.

In general, on-premise hosting is more expensive up-front and requires more work to run. However, it provides total flexibility and independence for the company. Cloud hosting is cheaper up-front and already comes with an initial/core infrastructure which make it easier to start working with. However, is less flexible and might close the company in the provider's tech ecosystem.
